

Tutorial: Boyce-Codd Normal Form

Your company, Apasaja Private Limited, is commissioned by Toko Kopi Luwak to design relational schema for the management of their coffee beans, drinks, and cafes.

A coffee bean is fully identified by its unique brand name or a combination of its cultivar and region (since the same cultivar can be grown in different region). For instance, we may have a coffee bean named “The Waterfall” which comes from a Tabi cultivar grown in Colombia.

A drink can be made utilizing a particular coffee bean. The name of the drink is only unique for a particular coffee bean. This means, we can have an “Espresso” made with “The Waterfall” or “La Bella” (which is a Pacamara cultivar grown in Guatemala). The price of the drink is also recorded.

A branch identified by its branch name may then sell the drink. A drink may be sold by zero or more branches. A branch may sell zero or more drinks. Additionally, the address of the branch is also recorded. Lastly, for each drink sold by a branch, we record the quantity sold to see which branch is the most profitable.

We are only given an abstract schema for this application as follows.

$$R = \{A, B, C, D, E, F, G, H\}$$

$$\Sigma = \{ \{A\} \rightarrow \{C, E\}, \quad \{A, B\} \rightarrow \{D\}, \quad \{F\} \rightarrow \{H\}, \quad \{C, E\} \rightarrow \{A\}, \quad \{B, C, E\} \rightarrow \{D\}, \\ \{A, B, F\} \rightarrow \{D, G\}, \quad \{B, C, E, F\} \rightarrow \{G\} \}$$

This tutorial continues from the computation of candidate keys and minimal cover in “Tutorial: Functional Dependencies”. You are advised to compute them before continuing.

Questions

Not all questions will be discussed during tutorial. You are expected to attempt them before coming to the tutorial. You may be randomly called to present your answer during tutorial. You are encouraged to discuss them on Canvas Discussion.

1. **Boyce-Codd Normal Form.**
 - (a) Is R with Σ in BCNF?
2. **Normalization.**
 - (a) Decompose R with Σ into a lossless-join BCNF decomposition using the algorithm from the lecture.
 - (b) Is the result dependency preserving?
 - (c) From the decomposition and the mapping of the attributes and the letters, can you figure out the mapping of fragments to the entity/relationship sets as mentioned in the text description?
